

GTS Zoom AI Companion – Meeting Summary Template Adoption Story

From Zoom Meetings to SDLC Intelligence

1. Objective

Enable GTS teams to make better use of the existing Zoom AI Companion Meeting Summary Templates to capture consistent meeting information across different SDLC activities.

The objective is not to create custom Zoom templates at this stage, because custom organizational templates are currently unavailable in our environment.

Instead: Use the appropriate existing Zoom template based on the meeting purpose → capture the Zoom AI Companion summary → pass the output to the GTS AI Agent platform → apply SDLC-specific processing with Human-in-the-Loop validation.

2. Currently Available Zoom Templates

Based on the Zoom environment currently available to GTS, the following standard templates are available.

3. Recommended Template Selection for GTS

Discussion should be the preferred default. For most GTS SDLC meetings, Discussion is the most appropriate starting point because a typical meeting contains a combination of requirements, business context, questions, decisions, key discussion points, actions, owners and follow-ups.

Users should select another available template when the meeting has a clearly different purpose.

4. Discussion

Best for: Pre-FSR / FSR / cross-functional requirement discussions.

Typical participants: Product Owner, Business Stakeholder, Country Stakeholder, BA, Architect, SMEs and Engineering representatives.

Typical content: business requirement, priority, clarification, impact, regulatory concern, decisions and next steps.

Recommendation: Use Discussion for the initial GTS Pre-FSR POC.

5. Project Update

Best for project status meetings, programme updates, delivery governance, release planning and steering meetings.

Capture progress, completed activities, current activities, upcoming activities, blockers, risks, dependencies, decisions and next steps.

GTS example: Weekly HTS migration project meeting. The resulting summary can be passed to a Project Planning Agent.

6. Stand Up

Best for daily engineering, BA, testing or SRE stand-ups.

Focus on Yesterday → Today → Blockers → Dependencies → Next steps.

Recommended downstream capability: Stand-up Summary / Project Tracking Agent.

7. Brainstorm

Best for architecture brainstorming, solution options, design alternatives, process improvement and technical innovation.

Capture ideas, alternatives, advantages, concerns, proposed options, decisions and follow-ups.

Recommended downstream capability: Solution Analysis Agent.

8. Next Steps

Best for meetings where the primary objective is to establish actions and ownership.

Useful for follow-up meetings, decision meetings and governance meetings.

Recommended downstream capability: Action & Dependency Agent.

9. Q&A;

Best for requirement clarification, SME sessions, knowledge transfer, architecture clarification, engineering questions and business clarification.

Recommended downstream capability: Requirement Clarification Agent.

Useful structure: Question → Answer → Evidence/statement → Remaining ambiguity.

10. Customer Success

Best for business/customer-facing discussions involving customer feedback, service expectations, customer pain points, business outcomes and follow-up requirements.

11. User Feedback

Best for business-user feedback, UX discussions, UAT feedback, product feedback and operational-user feedback.

Potential transformation: Feedback → Requirement → Business impact → Candidate change.

12. Lecture Summary

Best for GTS AI awareness sessions, training, knowledge-sharing sessions, architecture training and new-joiner sessions.

Not recommended for normal SDLC requirement meetings.

13. Recommended GTS Decision Tree

START ZOOM MEETING → What is the meeting purpose?

Requirement discussion → DISCUSSION

Status update → PROJECT UPDATE

Technical ideation → BRAINSTORM

Mostly questions → Q&A

Mostly actions → NEXT STEPS

Daily team update → STAND UP

User/business feedback → USER FEEDBACK

Training → LECTURE SUMMARY

14. How this fits the GTS AI Agent POC

Zoom → Select available template → Zoom AI Companion → Meeting Summary → GTS AI Agent Platform → Supervisor Agent → Requirement / Solution / Story Agents → Human in the Loop → FSR / FDD / JIRA.

The key principle is: Zoom captures and structures the conversation. The GTS AI platform reasons over it. Humans approve the final artifact.

15. Example: Pre-FSR

Meeting: "Pre-FSR – Buyer Bearing Enhancement". Participants may include Product Owner, BA, Country Business Stakeholder, Architect and SME.

Host selects Discussion because this is the closest available standard template for a broad requirement discussion.

Zoom produces the meeting summary. The GTS AI Platform receives the Zoom summary plus transcript/context.

Requirement Agent extracts business problem, objective, demand category, business requirements, impact, priority, urgency, regulatory considerations, risks, dependencies and open questions.

FSR Agent maps the extracted information against the actual GTS FSR structure shown in the supplied Jira screenshots, including Demand Category, Objective & Key Result, Problem Statement, Business Requirements, Impacted Products, Impacted Customers, Transaction/Revenue Impact, Customer Migration Plan, Regulation, Implications without FSR, Monthly Incidents/RTC and Distribution Impacts.

The agent identifies information that was not discussed instead of inventing it.

16. Human-in-the-loop

Zoom Summary → AI Extraction → Requirement Analysis → Gap / Ambiguity Detection → Human Review → Approved → FSR / FDD / User Story → Jira / Confluence.

Critical principle: The AI should explicitly flag missing information rather than fabricate it. Example: "Impacted live customers – information not discussed."

17. Important Current-State Constraint

Current-state constraint: The GTS Zoom environment currently provides Zoom's standard Meeting Summary Templates. Custom organizational meeting-summary templates are not currently available to GTS users. Therefore, this POC will use the existing standard Zoom templates and perform GTS-specific structuring, validation and transformation downstream through the GTS AI Agent platform.

18. POC Success Criteria

Meeting notes: Unstructured → Structured

Requirement extraction: Manual → AI-assisted

Missing information: Discovered manually → AI identified

Ambiguity: Manual review → AI flagged

Action extraction: Manual → Automatic

FSR preparation: Manual → AI-assisted

Human validation: Retained

Jira creation: Manual → AI-assisted after approval

Traceability: Limited → Meeting → Requirement → FSR → Story

19. Key Message

We are not replacing the Zoom Meeting Summary Template. We are using the best available Zoom template for the meeting type and building the GTS intelligence layer downstream.

This is a realistic and defensible POC for the current HSBC/GTS environment.

Appendix A – Available Zoom Templates and GTS Scenarios

Zoom Template	Primary purpose	GTS scenario
Discussion	General discussion / key points	Pre-FSR, FSR and cross-functional requirement discussions
Project Update	Progress and next steps	Project / delivery status
Stand Up	Quick team updates	Daily engineering / BA / testing / SRE stand-up
Brainstorm	Ideas and options	Solution/design brainstorming
Next Steps	Action-oriented summary	Follow-up / decision meetings
Q&A	Questions and answers	Requirement clarification / KT
Customer Success	Customer feedback and next steps	Business/customer stakeholder meetings

Zoom Template	Primary purpose	GTS scenario
User Feedback	Feedback and insights	UX / business-user feedback
Lecture Summary	Learning and assignments	Training / knowledge sessions
